

NZNF

Survey Results

This survey was conducted by Kevin Sampson for the NZNF in 1992.

This analysis by John Lowe, 1997.

There are 302 survey respondents from contemporary club members: 128 females and 174 males.

Also conducted was a separate survey of ex-members which had 81 respondents.

The responses from the ex-members are listed at the bottom of the questions page (with the comparison question number from responding members, where relevant).

The percentages detail:-

Note that in several cases the percentage area (on the right, normally) may use more than one 'base' or reference total, in order to make the details more useful.

In these cases there is an explanation that specifies which items are using which bases as the reference point.

Note too, that there's a difference between respondents and respondents, relevant to those results where more than one response could be chosen.
